

VIDEO DISTRIBUTION OVER ETHERNET WITH GUARANTEED QUALITY OF SERVICE

ETS Multicast is a point-to-multipoint Ethernet distribution service for the Nimbra One platform, developed to meet the demands of streaming media in a data communication environment.

ETS multicast provides guaranteed bandwidth, low and consistent delay and jitter - characteristics essential for the distribution of real-time critical content such as IP-TV and near Video-on-Demand.

ETS multicast is the only Ethernet multicast service enabling the guaranteed quality of service needed for perfect quality streaming media to any number of recipients. By distributing streaming content over multicasted unidirectional Ethernet channels, ETS multicast ensures maximal usage of network resources and secures the delivery of unmatched picture and audio quality.

Each multicast session can swiftly be assigned canalized bandwidth in increments of 512 kbps up to link capacity, helping operators and service providers to maintain full control over the service all the way down to the end user.
